

1. "Unable to Access Azure Portal"

Problem: Users cannot log in to the Azure portal.

Causes:

- Incorrect credentials.
- MFA (Multi-Factor Authentication) issues.
- User account is locked or disabled.

Solution:

1. Verify credentials and reset the password if necessary.
 2. Resolve MFA issues by verifying authentication methods under Azure Active Directory → Security → MFA.
 3. Check user account status under Azure Active Directory → Users and unlock or enable it if required.
-

2. "Error Deploying Azure Resources"

Problem: Deployment of resources fails with an error.

Causes:

- Insufficient permissions.
- Incorrect resource configurations.
- Quota limits exceeded.

Solution:

1. Ensure the user has the required permissions (e.g., Contributor or Owner role) for the subscription or resource group.
 2. Verify configurations and templates for errors.
 3. Check and increase quota limits under Subscriptions → Usage + quotas.
-

3. "Virtual Machine Not Starting"

Problem: Azure Virtual Machines (VMs) fail to start.

Causes:

- Insufficient resources in the selected region.
- Disk or network-related issues.

Solution:

1. Check the region's available capacity or move the VM to a different region.
 2. Verify that the associated disk and network resources are properly configured and accessible.
 3. Restart the VM after resolving the issue.
-

4. "Application Insights Not Displaying Data"

Problem: No telemetry data is shown in Application Insights.

Causes:

- Telemetry is not enabled in the application.
- Incorrect Instrumentation Key or Connection String.

Solution:

1. Verify the application is correctly configured to send telemetry data.
 2. Ensure the Instrumentation Key or Connection String matches the one in Application Insights.
 3. Check the logs for errors in sending telemetry.
-

5. "Azure Function App Timing Out"

Problem: Azure Function execution exceeds the timeout limit.

Causes:

- Function logic is not optimized.
- Timeout settings are too restrictive.

Solution:

1. Optimize the function code to reduce execution time.
 2. Increase the timeout duration in the app settings (`functionTimeout` setting).
 3. Consider using Durable Functions for long-running operations.
-

6. "Storage Account Access Denied"

Problem: Users cannot access data in an Azure Storage Account.

Causes:

- Incorrect access keys or SAS token.
- Firewall or network restrictions.

Solution:

1. Verify and regenerate access keys or SAS tokens if needed.
 2. Update firewall settings to allow the user's IP address.
 3. Ensure permissions are granted to the user or application via Azure RBAC.
-

7. "App Service Not Responding"

Problem: The hosted application in Azure App Service is not accessible.

Causes:

- Outage in the App Service region.
- Incorrect application configuration or code issues.

Solution:

1. Check Azure Service Health for any ongoing issues in the region.
 2. Review the application logs for errors.
 3. Restart the App Service and verify configuration settings.
-

8. "Azure SQL Database Connection Failed"

Problem: Unable to connect to Azure SQL Database.

Causes:

- Incorrect connection string.
- Firewall rules block access.

Solution:

1. Verify the connection string format and credentials.
 2. Add the client IP to the allowed list in the firewall settings (Azure SQL Server → Networking → Firewall Rules).
 3. Check the database status and availability.
-

9. "Azure DevOps Build Pipeline Failing"

Problem: Build pipelines in Azure DevOps fail to execute.

Causes:

- Missing or incorrect configurations in the pipeline.
- Insufficient agent resources or permissions.

Solution:

1. Review the pipeline configuration and YAML file for errors.
 2. Check agent logs for detailed error messages.
 3. Assign the required permissions to the pipeline and associated resources.
-

10. "Key Vault Access Denied"

Problem: Applications cannot access secrets in Azure Key Vault.

Causes:

- Misconfigured access policies or RBAC roles.
- Incorrect Key Vault endpoint.

Solution:

1. Add the application or user to the Key Vault access policies or assign appropriate roles (e.g., Key Vault Secrets User).
2. Ensure the application uses the correct endpoint to access the Key Vault.
3. Validate Managed Identity settings if applicable.

11. "Azure Resource Manager (ARM) Template Deployment Error"

Problem: ARM template deployment fails.

Causes:

- Syntax errors or missing parameters in the template.
- Incompatible resource dependencies.

Solution:

1. Validate the ARM template using Azure's built-in tools.
 2. Ensure all required parameters are defined and provided.
 3. Resolve resource dependency issues by specifying the correct order of deployment.
-

12. "Azure Policy Compliance Errors"

Problem: Resources are flagged as non-compliant with Azure Policies.

Causes:

- Resource configurations do not meet policy requirements.
- Incorrect scope or exclusions in the policy.

Solution:

1. Review the policy definition and affected resources under **Policy → Compliance**.
 2. Update the resource configuration to meet the policy requirements.
 3. Exclude specific resources if necessary.
-

13. "Log Analytics Workspace Not Receiving Data"

Problem: Logs are not being ingested into the Log Analytics workspace.

Causes:

- Diagnostic settings are not enabled.
- Misconfigured data sources.

Solution:

1. Enable diagnostic settings for the resource and link it to the Log Analytics workspace.
 2. Verify the data source configuration under **Log Analytics Workspace → Data Sources**.
 3. Check ingestion limits and ensure they are not exceeded.
-

14. "Error Configuring Azure CDN"

Problem: Azure CDN does not deliver content or throws errors.

Causes:

- Incorrect origin or endpoint configuration.
- Expired SSL certificate.

Solution:

1. Verify the origin URL and endpoint settings in the CDN profile.
 2. Renew or upload a valid SSL certificate for secure delivery.
 3. Purge cached content if changes have been made.
-

15. "Azure Kubernetes Service (AKS) Node Pool Issues"

Problem: Node pools fail to scale or function properly.

Causes:

- Insufficient VM quota in the region.
- Configuration issues with the cluster.

Solution:

1. Check VM quota limits and increase them if needed.
2. Verify cluster and node pool configurations under **Kubernetes Services** → **Node Pools**.
3. Restart the affected nodes or recreate the pool if necessary.

16. "Azure Blob Storage File Upload Fails"

Problem: Users are unable to upload files to Azure Blob Storage.

Causes:

- Incorrect permissions or access keys.
- File size exceeds the allowed limit.

Solution:

1. Verify that the user or application has **Storage Blob Data Contributor** or appropriate access permissions.
 2. Check and regenerate SAS tokens or access keys if required.
 3. Split large files into smaller chunks and use the Azure Blob Storage SDK for uploads.
-

17. "Azure Resource Lock Preventing Changes"

Problem: Unable to modify or delete resources due to a lock.

Causes:

- Resource is locked with a "ReadOnly" or "Delete" lock.

Solution:

1. Navigate to **Azure Portal** → **Resource** → **Locks**.
2. Identify and remove the lock if changes are necessary.
3. Add the lock back after modifications if required for security.

18. "Azure Automation Runbook Fails"

Problem: Runbooks fail to execute or complete as expected.

Causes:

- Errors in the PowerShell or Python script.
- Misconfigured variables or credentials.

Solution:

1. Review the runbook logs for detailed error messages.
 2. Update variables and credentials under **Azure Automation → Variables and Credentials**.
 3. Test the script manually to ensure it runs without errors.
-

19. "Azure AD Group Membership Not Updating"

Problem: Users are not being added or removed from Azure AD groups as expected.

Causes:

- Dynamic group rules are misconfigured.
- Synchronization issues with on-premises AD.

Solution:

1. Verify and correct the dynamic group rules under **Azure AD → Groups → Dynamic Membership Rules**.
 2. Check Azure AD Connect for synchronization errors and resolve them.
 3. Manually add or remove users if necessary while resolving the issue.
-

20. "Azure Virtual Network Gateway Connection Fails"

Problem: Site-to-site VPN connection is not working.

Causes:

- Incorrect configuration of IPsec/IKE settings.
- Outdated shared key.

Solution:

1. Verify and update the IPsec/IKE configurations on both ends of the VPN.
 2. Renew or correct the shared key under **Virtual Network Gateway → Connections**.
 3. Check the gateway's status and logs for additional troubleshooting.
-

21. "Azure Service Bus Messages Not Delivered"

Problem: Messages are stuck in the Azure Service Bus queue or topic.

Causes:

- Dead-letter messages due to expiration or processing errors.
- Misconfigured access policies.

Solution:

1. Review the dead-letter queue for details and resolve the errors causing the issue.
 2. Verify access policies under **Service Bus → Shared Access Policies**.
 3. Ensure the application processing the messages is running and connected.
-

22. "Azure Resource Group Deployment Fails"

Problem: Deployment of multiple resources in a resource group fails.

Causes:

- Dependencies between resources are not defined.
- Quota limits exceeded for the subscription.

Solution:

1. Update the deployment template to define dependencies explicitly.
 2. Check resource quotas under **Subscriptions → Usage + quotas** and increase them if needed.
 3. Retry the deployment after resolving the issues.
-

23. "Azure Logic App Not Triggering"

Problem: A Logic App does not trigger as expected.

Causes:

- Trigger conditions are not met.
- Authentication or connectivity issues with the trigger source.

Solution:

1. Review the trigger history and logs under **Logic App → Runs History**.
 2. Update the trigger configuration to ensure it matches the conditions.
 3. Verify that connectors and authentication are correctly configured.
-

24. "Azure Synapse Query Performance Issues"

Problem: Queries in Azure Synapse Analytics run slowly or time out.

Causes:

- Poorly optimized SQL queries.
- Insufficient compute resources.

Solution:

1. Optimize SQL queries by using indexes and reducing joins.
 2. Scale up or scale out the Synapse pool to increase compute resources.
 3. Use dedicated SQL pools for heavy workloads.
-

25. "Azure Monitor Alerts Not Working"

Problem: Alerts are not triggered for monitoring metrics or logs.

Causes:

- Incorrect alert rules or thresholds.
- Disabled alert action groups.

Solution:

1. Verify and update the alert rules under Azure Monitor → Alerts.
 2. Ensure the thresholds and conditions match the desired metrics or logs.
 3. Check that the action groups associated with the alert are enabled and configured correctly.
-

26. "Azure Batch Job Not Completing"

Problem: Batch jobs fail to complete or encounter errors.

Causes:

- Incorrect task configurations.
- Insufficient compute resources in the pool.

Solution:

1. Review task and job logs for errors under Azure Batch → Jobs.
 2. Check the pool's resource allocation and scale it up if needed.
 3. Update task configurations to resolve any identified issues.
-

27. "Azure Traffic Manager Failing to Route Requests"

Problem: Traffic Manager is not routing traffic correctly to endpoints.

Causes:

- Endpoints are unhealthy.
- Incorrect routing method configuration.

Solution:

1. Check the endpoint status under Traffic Manager → Endpoints.
 2. Update the routing method under Traffic Manager → Configuration to match the traffic distribution requirements.
 3. Ensure DNS records are correctly pointing to the Traffic Manager profile.
-

28. "Azure App Gateway Error 502 Bad Gateway"

Problem: The Azure Application Gateway returns a 502 error.

Causes:

- Backend servers are unreachable or misconfigured.
- Incorrect health probe settings.

Solution:

1. Verify backend server connectivity and ensure they are healthy.
 2. Update health probe settings to match the backend server's configurations.
 3. Check NSG and firewall rules to allow traffic between the Application Gateway and backend servers.
-

29. "Azure Cognitive Services API Error"

Problem: Cognitive Services API requests fail or return errors.

Causes:

- Invalid subscription key or endpoint.
- Exceeded rate limits.

Solution:

1. Verify the subscription key and endpoint under **Cognitive Services → Keys and Endpoints**.
 2. Optimize API usage to stay within rate limits or request a quota increase.
 3. Check for any service-specific errors in the API response logs.
-

30. "Azure Container Registry Authentication Fails"

Problem: Unable to authenticate or push images to Azure Container Registry.

Causes:

- Incorrect credentials or tokens.
- Misconfigured role assignments.

Solution:

1. Regenerate access tokens or keys under **Container Registry → Access Keys**.
2. Assign appropriate roles (e.g., AcrPush) to the user or service principal.
3. Verify the login command and endpoint in the CLI or SDK.

These additional Azure issues and solutions offer more troubleshooting insights for admins and developers working with Azure applications and services.

31. "Azure Function Execution Timeout"

Problem: Azure Function times out during execution.

Causes:

- Long-running operations exceed the default timeout.
- Improper configuration of timeout settings.

Solution:

1. Increase the timeout limit in the `host.json` file or the Azure Portal (Timeout property).
 2. Optimize the function code to reduce execution time by using asynchronous operations.
 3. Offload heavy processing to a background service, such as Azure Queue or Event Grid.
-

32. "Azure Key Vault Secret Not Accessible"

Problem: Applications cannot retrieve secrets from Azure Key Vault.

Causes:

- Missing access policies or permissions.
- Misconfigured managed identities or client credentials.

Solution:

1. Assign appropriate access policies under Key Vault → Access Policies.
 2. If using a managed identity, verify that the identity has Get permissions for secrets.
 3. Ensure the application is using the correct credentials or client ID to access the Key Vault.
-

33. "Azure Resource Deployment Stuck"

Problem: Resource deployment hangs or takes too long.

Causes:

- Dependencies are not met.
- Azure region experiencing service issues.

Solution:

1. Check the deployment status and error messages in the Activity Log.
 2. Verify dependencies and ensure that prerequisite resources are deployed correctly.
 3. Retry deployment in another region if service health issues persist.
-

34. "Azure SQL Database Connection Fails"

Problem: Unable to connect to Azure SQL Database.

Causes:

- Incorrect firewall rules.
- Authentication method mismatch (SQL authentication vs. Azure AD).

Solution:

1. Update firewall rules under SQL Server → Firewalls and Virtual Networks to allow client IPs.
 2. Verify connection strings for accuracy, including server name and credentials.
 3. Ensure the authentication method matches the configured credentials.
-

35. "Azure Logic App Connector Not Working"

Problem: A connector in Azure Logic App fails to execute.

Causes:

- Authentication token expired.
- Connector configuration issues.

Solution:

1. Reauthenticate the connector in the Azure Portal.
 2. Review and update the connector's settings under Logic App Designer.
 3. Check the service status of the integrated system (e.g., Office 365, ServiceNow).
-

36. "Azure Virtual Machine Boot Failure"

Problem: A virtual machine fails to boot or becomes unresponsive.

Causes:

- Corrupted OS or misconfigured VM settings.
- Disk errors or space issues.

Solution:

1. Use the Azure Serial Console to troubleshoot boot errors.
 2. Attach the VM's disk to another VM and recover data if necessary.
 3. Recreate the VM using a backup or snapshot.
-

37. "Azure Kubernetes Cluster Node Not Available"

Problem: One or more nodes in an Azure Kubernetes Service (AKS) cluster are unavailable.

Causes:

- Node scaling issues or resource limits.
- Outdated node configurations.

Solution:

1. Scale up the node pool under AKS → Node Pools.
 2. Run `kubectl describe node` to identify specific issues.
 3. Update the AKS cluster and node pool to the latest version.
-

38. "Azure DevOps Pipeline Fails"

Problem: Build or release pipelines in Azure DevOps fail to execute.

Causes:

- Missing permissions or incorrect configurations.
- Dependency errors in tasks.

Solution:

1. Review pipeline logs for error details under Azure DevOps → Pipelines.
 2. Verify agent pool availability and update permissions for the service connections.
 3. Reconfigure tasks or steps causing the error.
-

39. "Azure Storage Account Throttling"

Problem: Access to Azure Storage is slow or limited due to throttling.

Causes:

- Exceeding the throughput limit for the storage account.

Solution:

1. Scale up the storage account to a higher performance tier.
 2. Optimize storage access patterns by reducing the number of requests.
 3. Implement retry logic in the application to handle throttling gracefully.
-

40. "Azure App Configuration Not Reflecting Changes"

Problem: Updates to Azure App Configuration are not reflected in the application.

Causes:

- Application caching outdated configurations.
- Incorrect refresh intervals or triggers.

Solution:

1. Enable dynamic configuration refresh in the application code.
 2. Set proper refresh intervals or event triggers in the Azure App Configuration settings.
 3. Restart the application to force a configuration reload if necessary.
-

41. "Azure Site Recovery Fails"

Problem: Azure Site Recovery replication or failover fails.

Causes:

- Inconsistent replication settings.
- Insufficient resources in the target region.

Solution:

1. Review the replication settings and logs under **Site Recovery** → **Replicated Items**.
 2. Ensure the target region has sufficient compute, storage, and networking resources.
 3. Re-enable replication for affected items and retry failover.
-

42. "Azure AD Application Registration Fails"

Problem: Unable to register or configure applications in Azure AD.

Causes:

- Insufficient permissions.
- Conflicting configurations.

Solution:

1. Ensure the user has **Application Administrator** or **Global Administrator** roles.
 2. Resolve conflicting settings, such as redirect URIs, before saving the registration.
 3. Retry the registration process after resolving any errors.
-

43. "Azure CDN Content Not Updating"

Problem: Changes to the content are not reflected on the Azure CDN.

Causes:

- CDN caching outdated content.

Solution:

1. Purge the CDN cache under **CDN Profile** → **Purge**.
 2. Set appropriate cache-control headers to manage cache expiration.
 3. Verify origin server content to ensure updates are correctly deployed.
-

44. "Azure Backup Fails for Virtual Machines"

Problem: Backup operations for Azure VMs fail.

Causes:

- Inconsistent snapshot creation.
- Backup policy misconfiguration.

Solution:

1. Verify the backup policy settings under **Recovery Services Vault** → **Backup Policies**.
 2. Check the VM status and ensure that snapshots are successfully created.
 3. Re-run the backup job after resolving issues.
-

45. "Azure API Management Gateway Not Responding"

Problem: The API Gateway in Azure API Management fails to process requests.

Causes:

- Incorrect backend configuration.
- Gateway throttling due to excessive requests.

Solution:

1. Check and update backend service configurations under API Management → APIs.
2. Monitor gateway metrics and adjust rate-limiting policies to handle higher traffic.
3. Restart the gateway if necessary.
